ABSTRACT:

PROBLEM TO BE SOLVED: To detect a near sequential I/O and to perform the lookahead of data from a magnetic disk drive to a cache memory.

SOLUTION: A near sequential I/O processing part 23 is provided with an I/O history storage table 235 storing the transfer end address of I/O requested from a host 10 in the past, a near sequential I/O judging part 233 for calculating an address difference between the transfer end address read out of this I/O history storage table 235 and the transfer start address of this I/O transfer and judging the request of this I/O as a near sequential I/O when the address difference is settled within a fixed range, and a lookahead executing part 234 for performing the lookahead of data from a magnetic disk drive 40 to a cache memory 30 on the condition of detecting the near sequential I/O.
